- 1369 Role of double-hybrid density functionals and correlation consistent basis sets in OCS-hydrocarbon complexes**

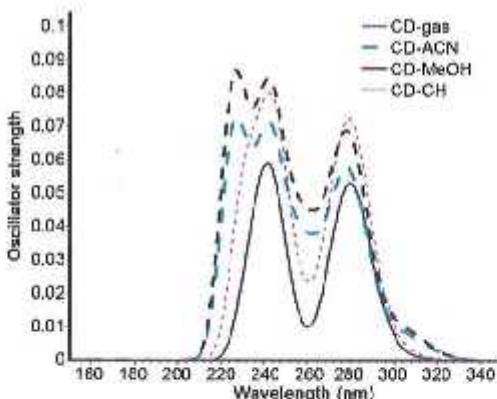

Five double hybrid density functionals (DHDFs) in conjunction with Dunning's correlation consistent aug-cc-pVDZ, aug-cc-pVTZ and aug-cc-pVQZ basis sets are investigated to describe the weak interaction of the T-shaped isomer of OCS-C₂H₂ and OCS-C₂H₄ weakly bound van der Waals complexes. Amongst these, the mpW2PLYP DHDF with aug-cc-pVQZ basis set gives the best results. Both method and basis set are important for obtaining accurate results for such weakly bound complexes.

- 1378 Towards understanding mode of action of L-dopa and carbidopa: DFT/TD-DFT analyses of their electronic and vibration spectra**

Electronic absorption and vibrational spectra of L-dopa and carbidopa are recorded experimentally in different solvents and also computed theoretically. Two IR marker bands have been identified for carbidopa. Natural transition orbital analyses clearly indicate that most of the leading transitions in L-dopa and some in carbidopa involve a sizable charge transfer from the aromatic catechol moiety to the aliphatic amino acid side chain. The short wavelength transition, however, shows an opposite trend.

- 1387 Mechanistic study of osmium(VIII) promoted oxidation of crotonic acid by aqueous alkaline solution of potassium iodate**

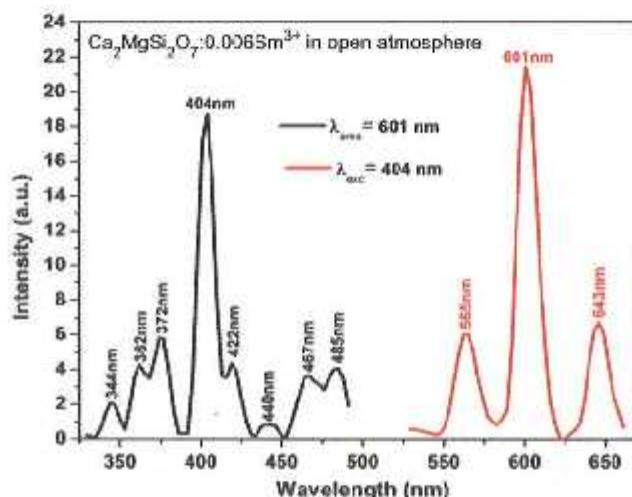

Kinetics and mechanism of osmium(VIII) promoted oxidation of crotonic acid by aqueous alkaline solution of potassium iodate have been investigated in the temperature range of 30–45 °C. A plausible mechanism involving attack of potassium iodate species on the complex formed between the catalytic species of osmium tetroxide and crotonic acid in slow and rate determining step is suggested. The rate law, consistent with observed kinetic results, is presented.

$$\text{Rate} = \frac{-d [\text{KIO}_3]}{dt} \\ = \frac{k d K_1 K_2 [\text{CA}] [\text{OH}^-] [\text{Os(VIII)}]_{\text{T}}}{1 + K_1 K_2 [\text{CA}] [\text{OH}^-]}$$

- 1394 Effect of activators and calcination on luminescence properties of akermanite type phosphors**

Novel akermanite type phosphors, Eu²⁺³⁺, Dy³⁺, Ce³⁺, Pr³⁺⁴⁺, Sm³⁺ separately-doped single-phased Ca₂MgSi₂O₇ are synthesized by conventional solid-state reaction method under open (air) atmospheric and/or weak reducing atmosphere comprising nitrogen and hydrogen. The Ca₂MgSi₂O₇ host structure exhibits emission of different colors due to the transitions of each doped rare earth ions. The difference in the measured emission spectrum is due to either different emission centers or same emission center with different ionic states occupying the same host lattice. The Ce³⁺-doping generates visible white light emission from the akermanite type phosphor. The study shows that the rare earth ions change the emission properties of the samples.

Notes

- 1402** **Piperazinium bis(μ_2 -phthalato)zincate(II) monohydrate: A new ladder coordination polymer with a unique supramolecular architecture**

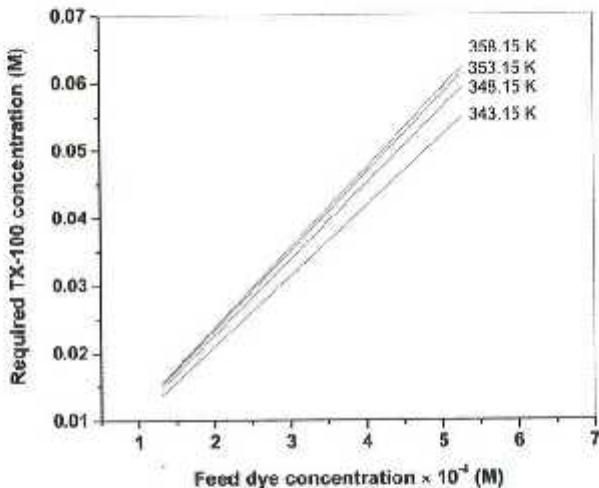

The μ_2 -bridging bidentate coordination modes of the crystallographically unique phthalate ligands in piperazinium bis(μ_2 -phthalato)zincate(II) monohydrate result in Zn²⁺Zn separations of 5.839(5) and 8.142(3) Å respectively, leading to a one-dimensional Zn(II) ladder. The organic cation, ladder complex anion and lattice water in $(\text{pipH}_2)[\text{Zn}(\text{pt})_2]\cdot\text{H}_2\text{O}$ assemble into a unique supramolecular network, resulting in the water:cation:water:ladder:water H-bonded sequence in the crystallographic *ac* plane.

- 1409** Ionic liquid mediated cloud point extraction of Blue BG dye

Cloud point extraction has been applied successfully for the separation of Blue BG dye using the ionic liquid, tetraethyl ammonium tetrafluoroborate, as an additive with non-ionic surfactant Triton X-100. The extraction of dye is found to increase with increase in temperature, time, surfactant concentration and ionic liquid concentration. A Langmuir type isotherm effectively describes the solubilization isotherms of the dye in TX-100.
